By its very nature, the *Internet Corporation for Assigned Names and Numbers* (ICANN) is a non-profit organization

exclusively run by Technocrats. As such, it is an apolitical body that is happy to serve whatever form of governance exists as long as funding is received and salaries are paid. To a Technocrat, a world run by science and technology is better than any other form of governance.

That Technocrats have played a supporting role in world history is unquestioned. Scientists, engineers and technicians played a huge role in the Communist dictatorship in the former Soviet Union (For instance, see [Science and the Soviet Social Order](#)). Technocrats likewise played a central role in support of Adolph Hitler and National Socialism (See [Scientists, Engineers and National Socialism](#)). In both cases, the Technocrat goal was not necessarily Communism or Nazism, but rather the methodical exercise of science according to its Scientific Method. In other words, the process was more important than the outcome – and in both cases, the outcome was not questioned or resisted, but simply accepted.

The reason that ICANN formerly served the interests of the United States was simply that it answered to our government’s judicial, legislative and executive branches. In other words, the U.S. held the umbrella over ICANN and that was enough to keep it working for our national interests and not for someone else’s interests.

Obama changed that when he cut ICANN loose on September 30, 2016 by letting the Internet Assigned Numbers Authority (IANA) contract expire without being renewed. After expiration, we forever lost the right to renew the contract again.

So, ICANN is now a “free-agent” looking for shelter in the same way that a boll weevil looks for a cotton plant: it needs a host organization in order to practice its craft, and, I dare say, it doesn’t care one whit who that host is.

It is no secret that the United Nations is making a play to become host to ICANN. In particular, the UN’s International Telecommunications Union (ITU), run by the Peoples Republic of China, is expected to play the

central role in this effort. However, whether it is the ITU or some other UN agency is immaterial because it will still be the UN in the end.

But, why the UN? Because it is the fountainhead of the plans and operations to establish Technocracy as the sole global economic system while destroying capitalism and free enterprise. Technocracy is the issue here. Others know it as Sustainable Development or Green Economy, but the correct historical term is Technocracy.

In February 2015, the head of climate change at the UN, Christiana Figueres, stated,

*“This is the first time in the history of mankind that we are setting ourselves the task of intentionally, within a defined period of time **to change the economic development model** that has been reigning for at least 150 years, since the industrial revolution.”* [emphasis added]

What is unclear about this? Sustainable Development, or Technocracy, is a resource-driven economic model regulated by energy rather than by supply and demand and uses monetary currencies. In 1938, the original Technocrats defined Technocracy as “the science of social engineering, the scientific operation of the entire social mechanism to produce and distribute goods and services to the entire population.”

To achieve its Utopia goals, the UN *must* have ICANN’s steering wheel and throttle. But while everyone is stressing over Internet censorship of web sites and the suppression of free speech, the real prize is completely overlooked: The Internet of Things (IoT).

In terms of “follow the money”, IoT is expected to generate upwards of \$3 trillion by 2025 and is growing at a rate of at least 30 percent per year. In other words, it is a huge market and money is flying everywhere. If the UN can figure out a way to tax this market, and they will, it will provide a windfall of income and perhaps enough to

make it self-perpetuating. Currently, the UN is financed by contributions from member states.

But, what is the IoT and who cares? IoT are the connections between inanimate objects and the humans that depend upon them. The digital Smart Meter on your home communicates energy usage via WiFi to the utility company; but it also communicates with the major appliances in your home and can even control them remotely without your consent or knowledge. The smart phone that you carry communicates with cell towers and localized signal receptors to create a map of your every movement. Smart home technology lets your stereo send sound to remote wireless speakers and to light bulbs equipped with sensors. The security camera that you installed to watch your home while you were on vacation can communicate with other cameras, microphones, the police department, etc. Examples go on and on.

ICANN issues the so-called IP addresses that are assigned to all these devices on a global basis. The original addressing scheme, IPV4, was based on four blocks of up to three digits each, punctuated with a period (e.g., 192.168.2.14). This scheme allows for a discrete address for up to 16.8 million devices. A few years ago, IPV4 ran out of numbers, forcing Internet service providers, corporations and other organizations to improvise internal numbering systems, known as 'proxy servers', to use safe addresses to devices within their own domain. These systems are not only fragile, but they are bloated beyond reason and generally easy to hack.

To fix this, ICANN devised a new IP numbering system called IPV6, which adds two more blocks of numbers (e.g., 192.168.2.14.231.58). This scheme provides for  $3.4 \times 10^{38}$  addresses, or 340 trillion, 282 billion, 366 million, 920 thousand, 938 — followed by 24 zeroes. There is probably a way to say this number, but I cannot imagine what it would be. It's somewhere beyond a trillion trillion unique numbers for every human being on earth!

Thus, IPV6 provides a way to assign a unique and directly addressable number to every electronic device on earth...

for centuries to come.

As IPV6 rolls out to the world, the modified mission for ICANN will be to inventory and categorize the device attached to each IP address. For instance, all the air conditioners in the world would be directly addressable from a single list. Likewise for all computers, all automobiles, all cameras, all phones, all refrigerators, all articles of clothing, etc.

Whoever has control over and access to this data will literally be able to control the entire world, down to the last minutiae – and that is the United Nations' exact mission: inventory, monitor and control.

But, this concept was set in history long before the technology existed. The original bible of Technocracy, the *Technocracy Study Course* (1934), laid out the hard requirements necessary for its implementation:

1. *“Register on a continuous 24 hour-per-day basis the total net conversion of energy.*
2. *“By means of the registration of energy converted and consumed, make possible a balanced load.*
3. *“Provide a continuous inventory of all production and consumption*
4. *“Provide a specific registration of the type, kind, etc., of all goods and services, where produced and where used*
5. *“Provide specific registration of the consumption of each individual, plus a record and description of the individual.” [Scott, Howard et al, *Technocracy Study Course*, p. 232]*

As I thoroughly documented in my book, *Technocracy Rising: The Trojan Horse of Global Transformation*, the United Nations is indeed the engine of modern Technocracy and as such, it is acting in a perfectly predictable manner. It seeks to establish a global Scientific Dictatorship where it controls all resources, all production and limits all consumption to its own liking. These Technocrats will dutifully apply their pseudo-

scientific methodology to every problem in the world, and simply issue instructions to the net to ‘make it so.’

Yes, free speech will decrease and censorship will increase, but that pales in comparison to the real prize of the IoT that the United Nations desperately wants and needs in order to accomplish its own twisted goals.

Congress never understood this when they passively let Obama fail to renew our contract with ICANN. However, Obama and his globalist handlers understood it perfectly well, which makes the deception and treachery of it even worse. Thanks to this scurrilous bunch, the world has just been sold into digital slavery, from which there may be no return.

**Rick | October 27, 2016 at 3:33 pm | Reply**

Very informative Patric, but while this points out some very interesting and disturbing possibilities, what options do you see now that ICANN has been cut loose? If it has not yet settled on a host, what Institution/Government/Body would be trustworthy with such potential power? I say none, but that aint gonna happen! Just a personal note; you used the term "Governance" and while it may be harder now then ever and getting worse by the day to prove this point because of the language destruction in the digital world, the term Governance refers to Corporations and not Government. This i have watched being

programed into the west and the east for years, simply because there may not be many Governments left on Earth, and that brings into question the our reality of a “Sovereign Nation” and being from Australia i have discovered that we are not lawfully a Nation etc.

**Patrick Wood | October 27, 2016 at 5:07 pm | Reply**

Governance generally refers to rule by regulations instead of by law. And, of course, it is the global corporations who are hammering out the rules with impunity. Just consider the TPP trade agreement, for instance.

Patrick,  
Do you believe that had ICANN remained under USA jurisdiction the Iot would not be implemented?—bet there would be a work-around, albeit delayed?

**Patrick Wood | October 27, 2016 at 7:04 pm | Reply**

The IoT will be implemented regardless of ICANN. The issue is who will inventory and control all the devices therein.

**Beth | October 27, 2016 at 6:02 pm | Reply**

Hi, again, Patrick,

I neglected to ask this question in my post of a few minutes ago: I found online a copy of Technocracy Study Course (1934). If you have read it and believe it offers substantial insight in to the birth of the movement, I will begin the foray—even if biting a bit more off than chewable for a newbie. Or, perhaps you would recommend other early writings...thanks, Beth

**Patrick Wood | October 27, 2016 at 7:05 pm | Reply**

Good for you! If you haven't yet read Technocracy Rising, I would suggest that for a starter. You can also listen to various videos on Technocracy.News/Media

Hi Patrick, Thank you so much for your perseverance to keep everyone informed. I had the privilege of working for you and your company in Scottsdale, AZ in 1979 as an assistant...inputting your writings of Trilaterals Over Washington. I know the technology for that inputting would have been much faster today! Thank you again for being WHO YOU ARE! Deborah
